Eventually, if we can get close enough and still keep the subject in focus, we can produce an image that's the same size as the subject. At that point, the ratio will be 1:1. This is sometimes called life-size or just X1 magnification. It is the point at which we pass from general close-up images to true macro.

Close Focus is surprisingly important in binoculars—birders don't just use their bins for long distances, but also for seeing things close up in great detail. A close focus will allow you great looks at birds (or insects), and will allow you to follow a nearby but hidden bird, keeping your quarry in focus until it decides to make an appearance.
